Investment Philosophy

Chartwell's approach to investing is grounded in fundamental research. We believe we can provide excess returns by investing in credits we have thoroughly researched and understand. As bond investors, we think there are three risks when investing in credit: business risk, liquidity risk, and covenant risk. Our goal is to fully understand these risks and then apply relative value screens as well as a top-down macro-overlay to identify favorable investment opportunities.

Strategy Overview

- The Core strategy's benchmark is the Bloomberg U.S. Aggregate Index.
- This strategy invests across a number of asset classes including, but not limited to: High-Grade Corporate Credit, Mortgage-Backed Securities (MBS), Asset Backed Securities (ABS), Commercial Mortgage Backed Securities (CMBS), Agencies, Treasuries, and Treasury Inflation Protected Securities (TIPS).
- Asset allocation is active and asset class exposures can vary over intermediate time periods.
- Duration will reside between 80%-120% of the U.S. Aggregate Index.

INVESTMENT PROCESS

Credit Research

On average, each of our analysts are actively following 30-40 credits. This pool of companies is where we draw corporate credit exposure from and how we believe we can generate much of our alpha.

Where do we see value?

The team analyzes different asset classes to discern where relative value lies. Within these asset classes, the team reviews individual securities and compares them to similar securities to uncover the optimal relative value.

Where Are We in the Economic Cycle?

The purchase of a certain asset class or security must make sense within the context of our economic outlook. Understanding where we are in the economic cycle helps guide our asset allocation as well as the duration exposure for the portfolio.

Risk Analysis

A constant question we ask ourselves is, "Where are we wrong?" This applies to individual credits, but also to asset class exposure, duration, convexity, as well as certain quality metrics. Limiting downside exposure is a key factor in our decision-making process and is a large reason why we have maintained a beta below 1.0 while historically producing excess returns against the Index.

Past performance is not a guarantee of future results. The calculation of the performance data includes reinvestment of all income and gains and is depicted on a time-weighted and size-weighted average for the entire period. Calculations include reinvestment of all income and gains. Performance is shown before (gross) and after (net) the deduction of both management fees and transaction costs. The net returns reflect the application of the highest institutional account management fee of 0.30% annum.

Chartwell Investment Partners, LLC claims compliance with the Global Investment Performance Standards (GIPS®). Chartwell Investment Partners has been independently verified for the period ended December 31, 2025. GIPS® is a registered trademark of CFA Institute. CFA Institute does not endorse or promote this organization, nor does it warrant the accuracy or quality of the content contained herein.

Chartwell Investment Partners, LLC (Chartwell), founded in 1997, is an independent investment management firm registered under the Investment Advisors Act of 1940. Chartwell manages a variety of equity, fixed income, and balanced assets for institutional, sub-advisory, as well as wrap/separate managed accounts clients. In January 2014, Chartwell became a wholly owned subsidiary of TriState Capital, restructuring as an LLC. In April 2016 and April 2018, The Killen Group and Columbia Partners were acquired. In June 2022, Chartwell became a wholly owned subsidiary of Raymond James, Inc. Chartwell's firm assets of $10.8 billion include $1.1 billion in non-discretionary assets as of 09.30.2026.

Risk Considerations: Historically, bonds have indeed provided less volatility and less risk of loss of capital than has equity investing. However, there are many factors which may affect the risk and return profile of a fixedincome portfolio. The two most prominent factors are interest-rate movements and the creditworthiness of the bond issuer. Generally, when interest rates rise, bond prices fall and when interest rates fall, bond prices generally rise. The risk of a change in the market value of the investment due to changes in interest rates is known as interest-rate risk. Interest-rate risk is subject to many variables but may be analyzed based on various data (e.g., effective duration). The risk that the issuer may default on interest and/or principal payments is often referred to as credit risk. Credit risk is typically measured by ratings issued by ratings agencies such as Moody's and Standard & Poor's. A credit rating of a security is not a recommendation to buy, sell or hold the security and may be subject to review, revision, suspension, reduction or withdrawal at any time by the assigning Rating Agency. Ratings and insurance do not remove market risk since they do not guarantee the market value of the bond. Bonds issued by the U.S. Government have significantly less risk of default than those issued by corporations and municipalities. However, the overall return on Government bonds tends to be less than these other types of fixed-income securities. Finally, reinvestment risk is the possibility that the proceeds of a maturing investment must be invested in a lower yielding security, all other things held constant, due to changes in the interest-rate environment. Investors should pay careful attention to the types of fixed-income securities which comprise their portfolio, and remember that, as with all investments, there is the risk of the loss of capital. Mortgage-backed securities (MBS) are subject to scheduled and unscheduled principal payments as homeowners pay down or prepay their mortgages. As a result, the effective maturity of a mortgage-backed security is virtually always shorter than its stated maturity. Asset-backed securities and mortgage-backed securities are created by pooling loans from a variety of sources and issuing bonds which are backed by these loans. Creditworthiness stems from the credit quality of the underlying loans, as opposed to corporate bonds in which creditworthiness is derived from the earning power of the issuing company. The primary risk of these securities is interest-rate risk. Rising interest rates might cause loan principal prepayments to slow, resulting in less available principal to invest at prevailing higher rates. Conversely, rate decreases might accelerate prepayments, leaving more dollars to invest at lower rates.

The performance data quoted represents past performance; past performance does not guarantee future results. Current performance may be lower or higher than the performance data quoted. The gross returns were calculated on a time weighted basis, including all dividends and interest, accrual income, realized and unrealized gains or losses and are net of all brokerage commissions, execution costs and do not give effect to investment advisory fees, which would reduce such returns. The net returns presented above were calculated by applying the highest institutional investment advisory fee paid by a client of Chartwell. The investment advisory fee schedule for institutional portfolios is: 0.30% on first $20 million, 0.25% on the next $20 million, 0.20% on the next $60 million, 0.15% on all additional assets.

The Bloomberg Capital U.S. Aggregate Index returns are provided to represent the investment environment existing during the time periods shown. For comparison purposes, the index is fully invested and includes the reinvestment of income. The returns for the index do not include any trading costs, management fees, or other costs. Index returns have been taken from published sources. Index returns have been taken from published sources. Index returns have been taken from published sources. Indices are unmanaged, and one cannot invest directly in an index. Market index results shown are not reduced by any fees as an index is unmanaged.

Bloomberg U.S. Aggregate Bond Index or the Agg: is a broad base, market capitalization-weighted bond market index representing intermediate term investment grade bonds traded in the United States. Investors frequently use the index as a stand-in for measuring the performance of the US bond market.
